## Research Funding

From December 1997 through August 2002, I worked at Bell Labs (Lucent Technologies) where all funding was internal. I started to actively pursue grants after I moved to academia, in late 2002. Since then, I have received grants, contracts and gifts (funded by NSF, DOE, NIH, State of Utah, IBM, Microsoft, Google, Moore Foundation, Sloan Foundation, Keck Foundation, Yahoo!, DARPA). Besides academic research funding, I have helped VisTrails Inc. obtain funding from the University of Utah, State of Utah, NSF, and DOE for business and product development.

### Freely-Available Software Systems and Web Sites

- **Data Polygamy**: scalable topology-based framework that automatically identifies relationships between salient features across large collections of spatio-temporal data sets. <https://github.com/ViDA-NYU/data-polygamy>
- **STIG/MongoDB**: GPU-based spatio-temporal index integrated into MongoDB. This index provides sub-second response times to queries over large spatio-temporal data sets and is orders of magnitude faster than commercial and open-source databases. <https://github.com/harishd10/mongodb>
- **ReproZip**: ReproZip is a tool that automatically captures the provenance of experiments and packs all the necessary files, library dependencies and variables to reproduce the results. Reviewers can then unpack and run the experiments without having to install any additional software. <https://github.com/ViDA-NYU/reprozip>
- **TaxiVis**: TaxiVis is a visual analytics systems that supports the interactive analysis of spatio-temporal data. <https://github.com/ViDA-NYU/taxivis>, <http://taxivis.org>
- **ReproMatch**: ReproMatch was designed to help users find the tools that best match their reproducibility needs. The tools in the ReproMatch catalog are classified according to different reproducibility tasks, which we organized in a taxonomy. <http://repromatch.poly.edu>
- **Domain Discovery Tool (DDT)**: DDT is an open-source, visual analytics framework for interactive domain discovery that augments the functionality provided by search engines. The system supports the exploratory analysis of web pages, and translates the expert's interactions with this data into a computational model of the domain of interest. [https://github.com/ViDA-NYU/domain\\_discovery\\_tool](https://github.com/ViDA-NYU/domain_discovery_tool)

- **ACHE:** ACHE is an open-source, focused Web crawler. <https://github.com/ViDA-NYU/ache>
- **VisTrails:** VisTrails, an open-source, provenance-aware scientific workflow management system that provides support for exploratory computational tasks, such as simulations, data analysis and visualization. <http://www.vistrails.org>
- **noWorkflow:** noWorkflow transparently captures provenance of scripts and enables reproducibility. The system is non-intrusive relies on techniques from Software Engineering, including abstract syntax tree analysis, reflection, and profiling, to collect different types of provenance without requiring a version control system or an instrumented environment. noWorkflow is available as open source software at <https://github.com/gems-uff/noworkflow>
- **BirdVis:** BirdVis is a tool that supports interactive analysis and visualization of spatio-temporal predictive models for bird distribution. The system was developed as part of a collaboration among computer scientists, statisticians, biologists and ornithologists. <http://www.birdvis.org>
- **DEFOG:** DEFOG is an information visualization system based on a model where each element is backed by all of its data regardless of how it is represented in the visualization. Users are free to add, copy, select, reorder, and group objects before and after a visualization has been applied. Objects from different visualizations can be easily combined or a subset of objects in a visualization can be selected and visualized in a different manner.
- **DeepPeep:** DeepPeep was a search engine specialized in Web forms. It helps users discover the entry points to content in Deep Web (aka Hidden Web) sites, including online databases and Web services. The system was featured in the New York Times.
- **crowdLabs.org:** crowdLabs adopts the model used by social Web sites and integrates a set of usable tools and a scalable infrastructure to provide an environment for scientists to collaboratively analyze and visualize data. The system combines benefits of social Web sites and science portals while at the same time addressing their limitations. Similar to social Web sites, crowdLabs aims to foster collaboration, but unlike these sites, it was specifically designed to support the needs of computational scientists, including the ability to access high-performance computers and manipulate large volumes of data. By providing mechanisms that simplify the publishing and use of analysis pipelines, it allows users to collaboratively construct and refine portals. This lowers the barriers for the use of scientific analyses and enables broader audiences to contribute insights to the scientific exploration process, without the high costs incurred by traditional portals.
- **Siphon++:** Siphon++ is a hidden-Web crawler that automatically retrieves contents hidden behind keyword-based query interfaces.
- **ShreX:** ShreX is a freely-available system for shredding, loading and querying XML documents in relational databases. It supports a wide range of XML-to-relational mappings; provides generic document shredding and query translation capabilities; and works with virtually any RDBMS.
- **StatiX++:** StatiX++ is a freely-available result estimator for XML queries. It uses histograms to uniformly capture both the structural and value skew present in documents. It leverages schema information to produce high-quality and concise statistical summaries.
- **XSB:** XSB is a deductive database/Prolog system that runs on over a dozen platforms (e.g., Linux, Windows 95/98 and NT, Solaris, SGI, etc), and has thousands registered users world wide. I was part of the XSB development team from 1993 to 1997.

- **Syntactica and Semantica:** Syntactica and Semantica are applications (workbooks) used to teach introductory courses of syntax and semantics. The applications and their manuals are available at bookstores or directly from MIT Press at <http://mitpress.mit.edu>.
